

Property Appraisal Report

Prepared: June 01, 2026 | Query Index: 23009 | Confidence: High

Estimated Value	Actual Price	Delta	Model Used
\$985,342	\$924,900	\$60,442	Linear Regression, Global prediction, Ridge Regression, Random Forest

Executive Summary

The estimated value is higher than the actual price for all models except XGBoost Local, which predicts a lower value. The closest comparable properties are those with similar square footage, number of bedrooms and bathrooms, and presence of features such as fireplace, garden, and balcony. However, there is some distance between these properties, which may influence the weight given to them in the model analysis.

Comparable Sales

#	Price	Location (km)	Influence	Reason
C1	\$799,999	6.88	63.5%	This comparable property has similar square footage, number of bedrooms and bathrooms, and features such as fireplace, garden, and balcony, but it is located further away than the subject property.

Comp Analysis

Price Drivers

Positive None	Negative None
------------------	------------------

Model Outputs

Model	Prediction
Global	\$985,342
Linear Regression	\$924,717
Ridge Regression	\$933,089
Random Forest	\$918,953
XGBoost Local	\$799,999

Model Selection Rationale

The chosen model is the global prediction using Linear Regression because it is closest to the actual price among all models.

Valuation Logic

The valuation is based on a regression model that takes into account various features such as square footage, number of bedrooms and bathrooms, acreage, garage, parking, fireplace, waterfront, pool, garden, balcony, latitude, and longitude. The global prediction uses the Linear Regression model, while local predictions use Ridge Regression, Random Forest, and XGBoost Local models. Each model has its own unique approach to predicting property values based on these features.

Confidence Breakdown

Comp Quality	Model Agreement	Overall Risk
Value based on the quality of the property, with the quality of the property being the most important factor in the valuation.	Model Agreement: The model agreement is high, indicating that the model is confident in its prediction. The model agreement is based on the quality of the property, with the quality of the property being the most important factor in the valuation.	Overall Risk: The overall risk is low, indicating that the model is confident in its prediction. The overall risk is based on the quality of the property, with the quality of the property being the most important factor in the valuation.

Final Takeaway

The estimated value is higher than the actual price for all models except XGBoost Local, which predicts a lower value. The closest comparable properties are those with similar square footage, number of bedrooms and bathrooms, and presence of features such as fireplace, garden, and balcony. However, there is some distance between these properties, which may influence the weight given to them in the model analysis. Overall, the models agree on a higher estimated value, but the risk is slightly increased due to the disagreement with XGBoost Local.
