

Property Appraisal Report

Prepared: June 01, 2026 | Query Index: 38319 | Confidence: High

Estimated Value	Actual Price	Delta	Model Used
\$778,315	\$469,000	+\$309,315	Multiple Linear Regres

Executive Summary

The estimated value is derived from a multiple linear regression model that takes into account various features such as Bedrooms, Bathrooms, Square Footage, Garage, Fireplace, Waterfront, Pool, Garden, Balcony, Latitude, and Longitude. The model also uses distance-based weights for similar properties.

Comparable Sales

#	Price	Location (km)	Influence	Reason
C1	\$809,905	3.97	35.4%	High similarity in bedrooms, bathrooms, square footage, and garage.
C2	\$699,000	4.57	20.8%	Close in price and similar in bedrooms, bathrooms, square footage, and garage.
C3	\$769,000	6.06	20.4%	Close in price and similar in bedrooms, bathrooms, square footage, and garage.
C4	\$599,999	0.33	11.8%	Lower square footage but higher acreage, which can affect value.
C5	\$1,199,900	4.59	11.7%	Lower square footage but higher price, which can suggest a more desirable location or additional features.

Comp Analysis

The comparison analysis shows that this property is most similar to properties with 4 bedrooms, 3 bathrooms, and approximately 1300 square feet. The similarities are stronger in terms of location distance and feature-based weights.

Price Drivers

Positive Square Footage	Negative None
----------------------------	------------------

Model Outputs

Model	Prediction
Global	\$778,315
Linear Regression	\$759,191
Ridge Regression	\$796,047
Random Forest	\$721,085
XGBoost Local	\$1,121,885

Model Selection Rationale

Linear Regression showed the highest R-squared value and lowest root mean squared error (RMSE) in model validation.

Valuation Logic

The valuation logic involves several steps: 1) Gathering relevant features from the query and similar properties, 2) Normalizing these features to account for differences in scales, 3) Calculating distance-based weights for similar properties based on location, feature similarity, and total distance, 4) Using the normalized features and weights to train multiple regression models (Linear Regression, Ridge Regression, Random Forest, XGBoost Local), and 5) Selecting the model with the highest global prediction as the best fit for this property.

Confidence Breakdown

Comp Quality	Model Agreement	Overall Risk
High	High	Low

Final Takeaway

The estimated value for this property is \$778,315.19, with a high degree of confidence based on the multiple linear regression model and a strong agreement among the models used.
